

Preliminary Sampling Design for Validation of Operational Chlorophyll Product

Issue:

- Collection of in-situ observations not designed for validation of operational satellite-derived ocean biology products

Task:

- Design a survey to collect in-situ water samples in the Gulf of Maine that will maximize precision of the validated chlorophyll estimates while minimizing cost

Recommendations*:

- Stratify Gulf of Maine by region and depth
- Use Optimal Allocation to minimize cost while maximizing precision
- Employ Systematic Sampling within strata

Future Plans:

- Examine assumptions used and modify sampling plan and formulation accordingly
- Apply to other regions and operational products

Scenario 1: Estimating the precision that can be achieved

| | |
|----------------------------------|--------------|
| Total variable cost available: | \$500,000.00 |
| Expected level of precision: | 0.02051 |
| Constant of proportionality (K): | 0.01307 |
| Total sample size: | 836 |
| Overall element variance: | 29.2897 |
| Design Effect: | 0.5867 |

| Stratum (h) | Population Total (N _h) | Weight (W _h) | Average Squared Difference | Element Standard Deviation (S _h) | Cost per Sample (c _h) |
|------------------|------------------------------------|--------------------------|----------------------------|--|-----------------------------------|
| 1. Banks | 52,382.0 | 0.1389 | 0.3787 | 0.3594 | \$2,260.00 |
| 2. Open Ocean | 191,173.0 | 0.5068 | 0.4145 | 2.1341 | \$2,260.00 |
| 3. Coastal Water | 133,650.0 | 0.3543 | 1.5926 | 7.4350 | \$326.67 |
| total | 377,205.0 | | 0.8608 | | |

Scenario 2: Calculating the total variable cost required

| | |
|----------------------------------|--------------|
| Desired level of precision: | 0.05 |
| Total variable cost required: | \$205,419.82 |
| Constant of proportionality (K): | 0.00537 |
| Total sample size: | 343 |
| Overall element variance: | 29.2897 |
| Design Effect: | 0.5869 |

| Stratum (h) | Population Total (N _h) | Weight (W _h) | Average Squared Difference | Element Standard Deviation (S _h) | Cost per Sample (c _h) |
|------------------|------------------------------------|--------------------------|----------------------------|--|-----------------------------------|
| 1. Banks | 52,382.0 | 0.1389 | 0.3787 | 0.3594 | \$2,260.00 |
| 2. Open Ocean | 191,173.0 | 0.5068 | 0.4145 | 2.1341 | \$2,260.00 |
| 3. Coastal Water | 133,650.0 | 0.3543 | 1.5926 | 7.4350 | \$326.67 |
| total | 377,205.0 | | 0.8608 | | |

Formulation to estimate the precision expected for a specified amount of funding (top frame) and the cost required to achieve a specified precision (bottom frame) for validating satellite-derived chlorophyll concentration in the Gulf of Maine. Optimal stratum sample size is also calculated.
