

West Nile Virus

The SCSB goal is to identify what information is needed by the CDC to more accurately identify outbreaks of mosquitoes. This CDC map, lower right, illustrates the outbreak of human and animal WNV. These graphs indicate information from the runs of individual models. When the summer moves farther forward into the season, and fewer “probable” weather data is included (e.g., historical climate), the diagram of timelines will approach the same crossover time (Kunkel, et al, 2006).
