

# Improvements in Real-Time Tropical Cyclone Products

Mark DeMaria, John Knaff and Ray Zehr  
NESDIS/StAR/RAMM Branch

Andrea Schumacher  
CIRA/CSU

Presented at the  
StAR Science Forum  
May 31, 2007

# Outline

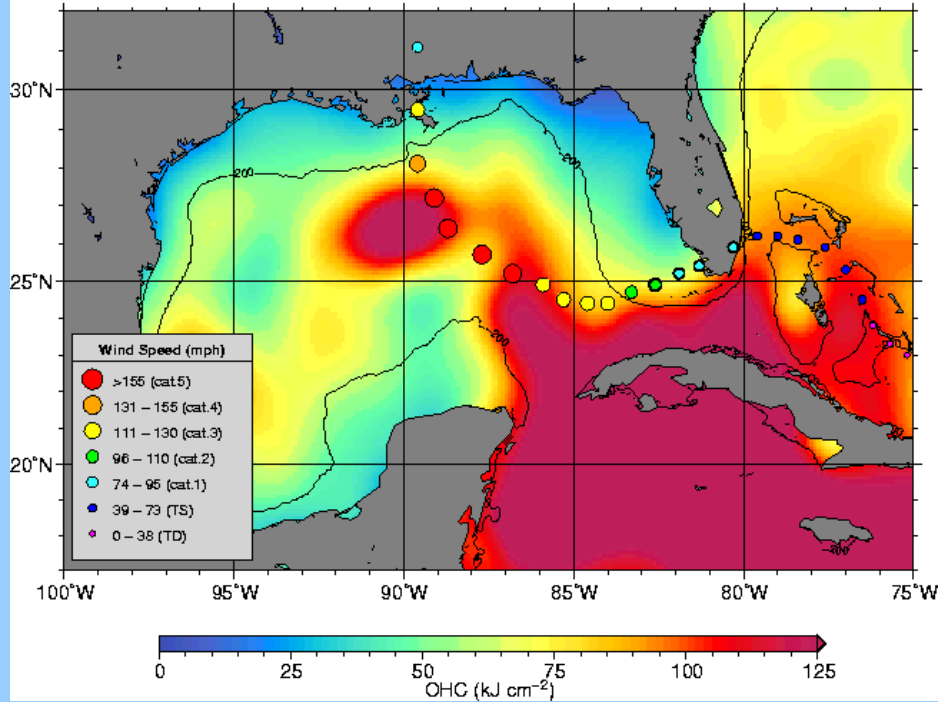

- Mark DeMaria
  - Improvements in the Statistical Hurricane Intensity Prediction Scheme (SHIPS) for the 2007 Hurricane Season
- John Knaff
  - The RAMMB Experimental Tropical Cyclone Web Page
- Andrea Schumacher
  - Extension of the NESDIS operational tropical cyclone formation probability product to the Central and Western Pacific
- Ray Zehr
  - Satellite support for the NOAA/AOML Hurricane Research Division annual field program

# 2006 Operational SHIPS Intensity Model

- Statistical-dynamical TC intensity prediction model
- 16 basic predictors
  - atmospheric from GFS forecast fields
  - oceanic from Reynold's weekly SST
  - climatology and persistence from ATCF input
- Satellite input
  - Ocean heat content from satellite altimetry
  - Convective parameters from GOES channel 4
- Empirical decay equation over land
- Experimental Logistic Growth Equation (LGE) version also run that uses time stepping procedure

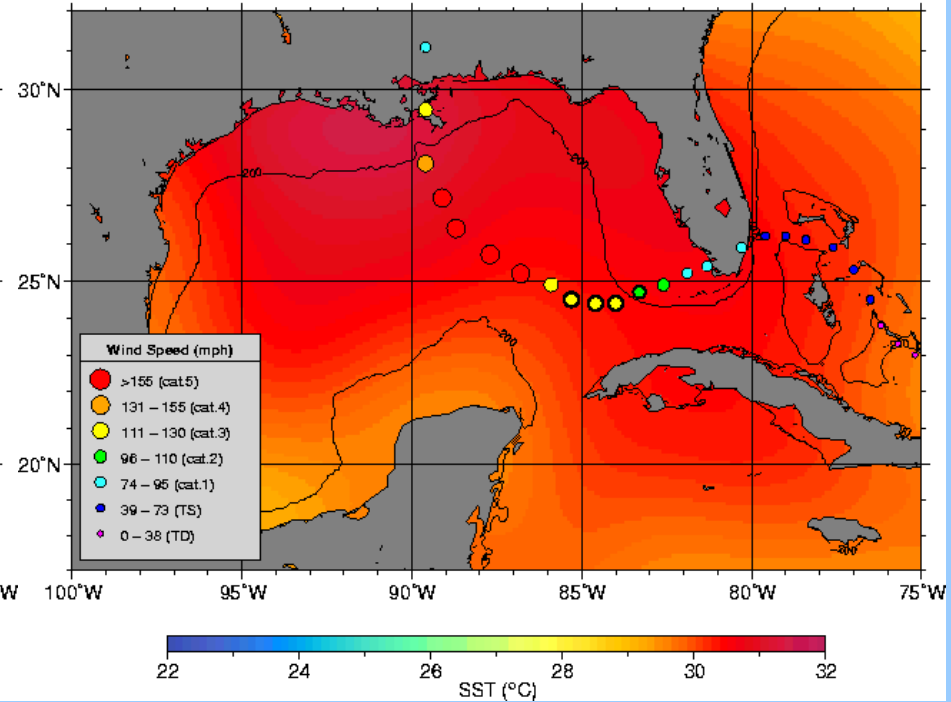

# Operational SHIPS Includes OHC from Satellite Altimetry Averaged Along the Storm Track as a Predictor

Ocean heat content (OHC) 08/26/2005

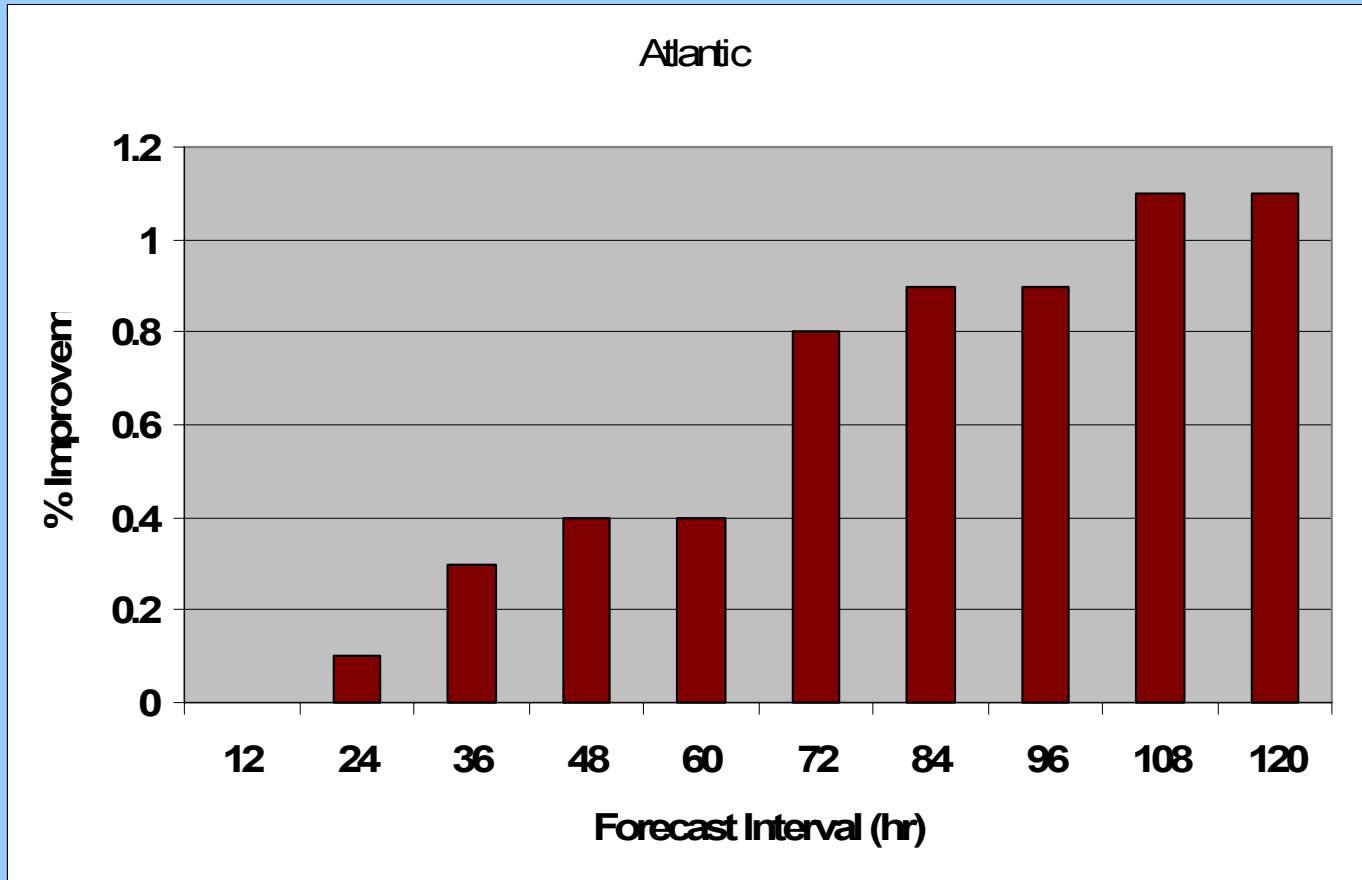

OHC

Sea surface temperature (SST) 08/27/2005

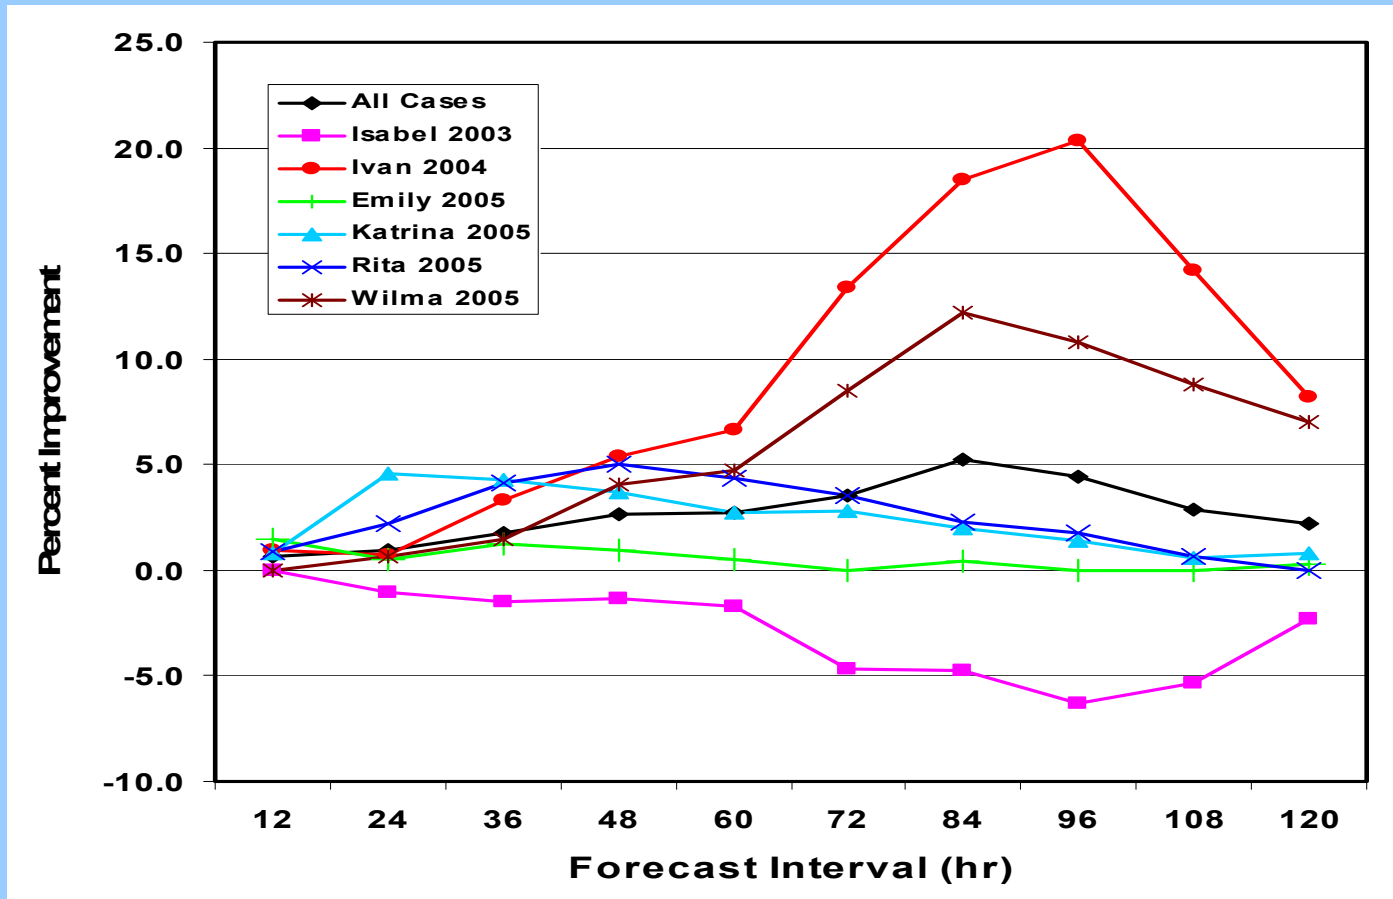

SST

# OHC Impact on SHIPS Forecasts

**Atlantic Sample: 3072 SHIPS Model Forecasts 1995-2006**

# OHC Impact Much Larger for Intense Atlantic Hurricanes

Improvements in Operational SHIPS Forecasts from OHC  
for all 2003-2005 Cat 5 Hurricanes  
(from Mainelli et al 2007)

# SHIPS Improvements for 2007

- Re-tuning of coefficients based on 2006 cases
- Refinement of method for calculation of vertical wind shear
- Add new vortex predictor from NCEP GFS model
- New code installed on the NCEP IBMs (Mist/Dew) on May 9th

# Improved Shear Calculation

- SHIPS uses NHC official track for center of shear calculation
- GFS vortex track can differ from NHC track
- Shear calculation uses large annulus to compensate (200-800 km)

# Example of NHC and GFS Track Mismatch

96 h Forecast for Frances from 27 Aug 2004 12 UTC

850 hPa

200 hPa

0.000E+00  
MAXIMUM VECTOR

0.000E+00  
MAXIMUM VECTOR

**G = GFS position**    **O = NHC Position**

# New Shear Algorithm

- Track location of GFS vortex at 850 hPa
  - Tracker finds location that maximizes 0 to 600 km symmetric tangential wind
  - Checks for reasonable translational speeds
  - Requires minimum cyclonic wind
- Symmetric circulation subtracted
  - Starts from outer radius where symmetric circulation is cyclonic
  - Subtraction radius decreases with height
- Shear calculation at NHC track position after vortex removed
- 0-500 km radius rather than 200-800 km annulus

# Example of Vortex Removal

## Total Wind

## Symmetric Flow

## Residual

Wind 2005 AUG28 12Z t=000 hr P= 850 mb

Winf 2005 AUG28 12Z t=000 hr P= 850 mb

Winf 2005 AUG28 12Z t=000 hr P= 850 mb

850 hPa

Wind 2005 AUG28 12Z t=000 hr P= 200 mb

Winf 2005 AUG28 12Z t=000 hr P= 200 mb

Winf 2005 AUG28 12Z t=000 hr P= 200 mb

200 hPa

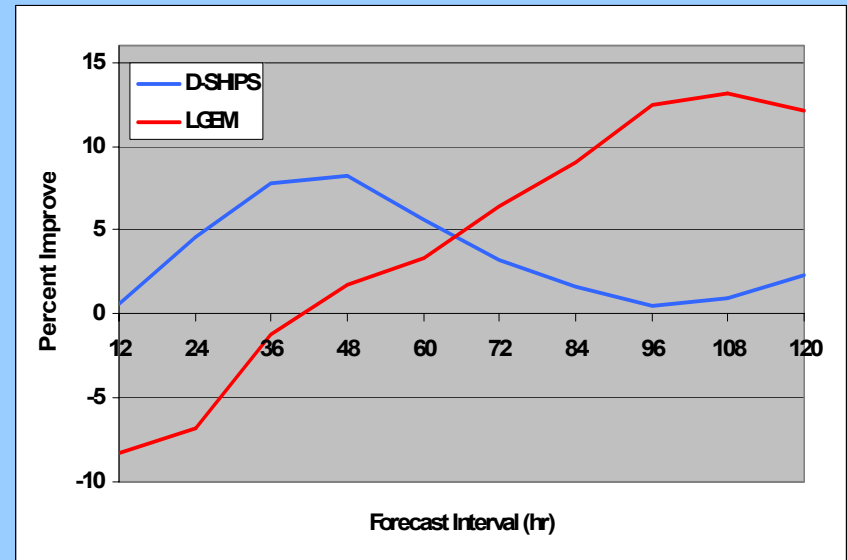

# A New Predictor for SHIPS

- GFS vortex removal procedure provides 850 tangential wind
- 0-600 km average GFS tangential winds found to be significant intensity change predictor
- Added to 2007 SHIPS

# 2007 Model Compared to Operational SHIPS (Re-runs of 2004-2006 seasons)

Atlantic

East Pacific

# Purpose

- To display real-time tropical cyclone products created and/or developed by RAMMB and CIRA scientists and products not available elsewhere.
- Serve these data to the public via a web integrated database designed to accommodate future product development.

# Information Content

## **Globally occurring tropical cyclones**

- Track history and current forecasts from NOAA (NHC or CPHC) or DOD/JTWC
- Earth relative IR loops (4-km Mercator)
- Storm relative LEO IR and Vis (1-km Mercator)
- **AMSU-derived radius vs. height cross sections (T and  $V_{\text{grad}}$ ) and intensity estimate time series**
- **Earth relative oceanic heat content + forecast track**
- **Multi-platform satellite only tropical cyclone surface wind analysis**
- **Digital Dvorak intensity estimate time series**
- **Storm relative TPW and water vapor imagery**

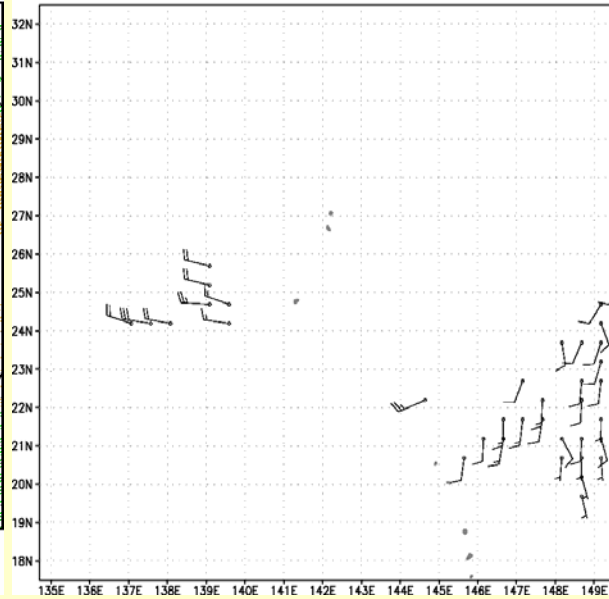

# Experimental Product Examples (TC wind analysis)

Storm Relative  
Total Precipitable Water

Storm Relative  
Water Vapor Imagery

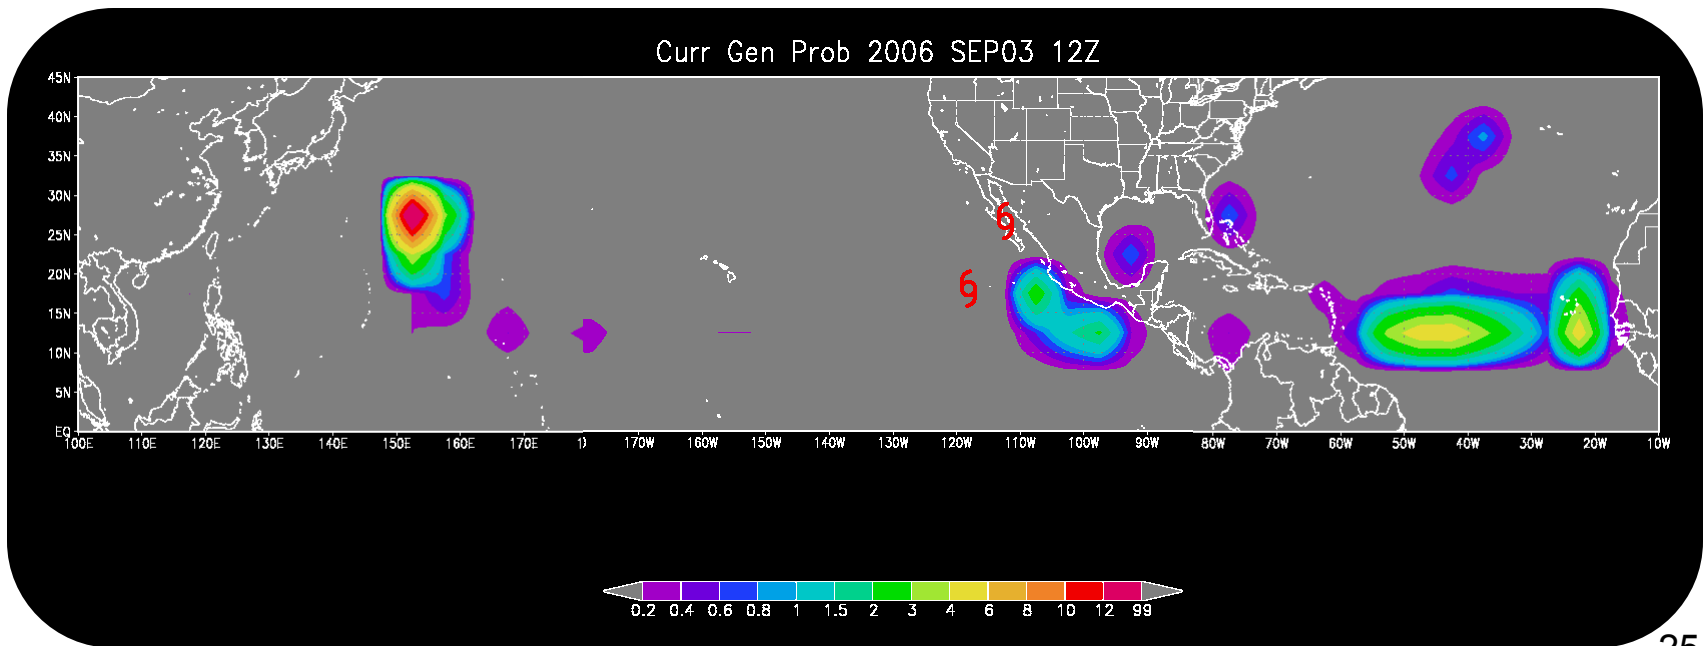

Blending of AMSU and SSM/I  
TPW is explained in  
Kidder and Jones (2007, JAOT)

# Future

- Add New products
  - STIPS and SHIPS forecast time series
  - 1-km forecast track relative visible imagery
  - Kinetic energy time series derived from the surface wind analyses
- Transition (try to) the experimental products
  - Multi-platform surface wind analysis
  - Ocean heat content
    - Use in STIPS based consensus
    - WMO website (maybe)
- Respond to user requests

# Extension of the NESDIS Tropical Cyclone Formation Probability Product to the Central and Western Pacific

# CURRENT TCFP PRODUCT - OVERVIEW

- Determines the 24-hr probability of TC formation within each 5° x 5° lat/lon grid box within the product domain (0° to 45° N, 140° to 350 W°)
- Uses the following data sources:
  - NCEP GFS operational analyses
  - GOES-East water vapor imagery
  - NHC Best tracks
- Running operationally at SSD since 2004 hurricane season.
- Shows plots of domain-wide formation probabilities, predictor values, and sub-basin time series. Updates every 6 hours.
- Available at : <http://www.ssd.noaa.gov/PS/TROP/genesis.htm>

# CURRENT TCFP PRODUCT – OVERVIEW (CONT...)

- CLIMATOLOGICAL FORMATION PROBABILITY (1949 – 2003)
- PERCENT LAND
- DISTANCE TO PREEXISTING STORM
- CLIMATOLOGICAL SST
- VERTICAL SHEAR (800 – 250 hPa)
- 850 hPa CIRCULATION
- VERTICAL INSTABILITY
- GOES COLD PIXEL COUNT
- CLOUD-CLEARED WATER VAPOR BRIGHTNESS TEMP.

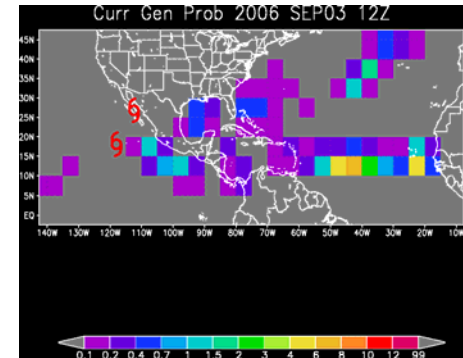

# CURRENT TCFP PRODUCT EXAMPLE – FLORENCE 2006

- 18 hr

- 12 hr

- 6 hr

- 0 hr = Time of TC Genesis

# CURRENT PRODUCT - VERIFICATION

Dependent probabilities are skillful by two measures

- Brier Skill Score
- Relative Operating Characteristic (ROC) score

## Interannual Variability

Expected Yearly # TCs =

$$\iiint P(x,y,t)dx dy dt$$

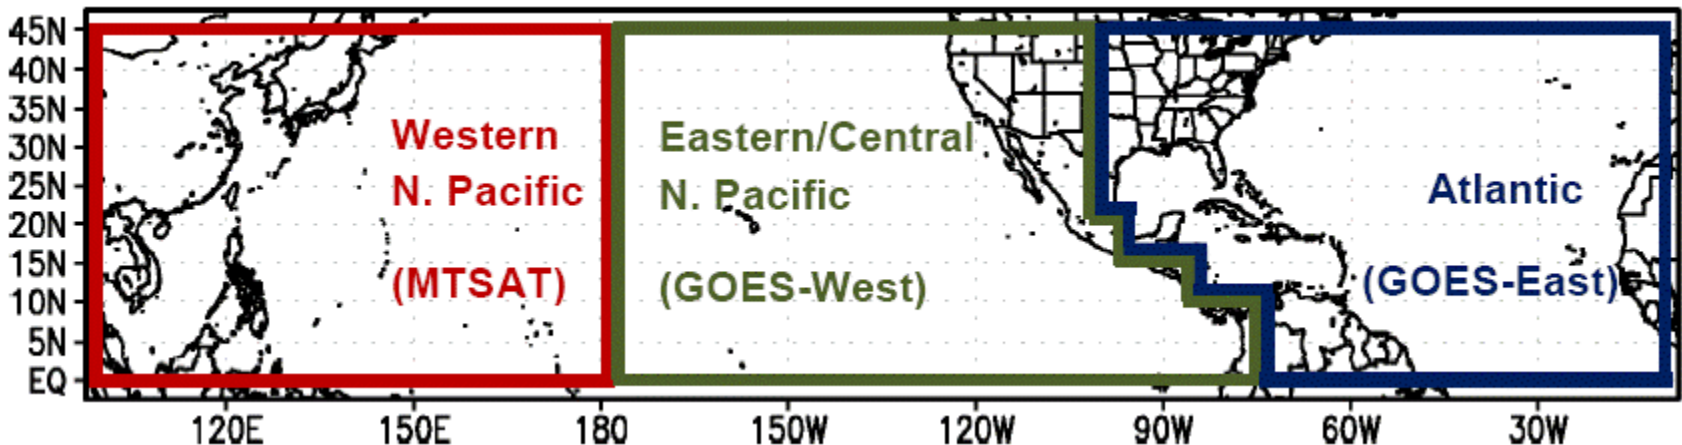

# UPDATED TCFP PRODUCT

- Expanded domain to cover Central & Western N. Pacific Basins
- Compiled data for algorithm development in Central & Western Pacific regions
  - NCEP global GFS fields
    - Reanalysis 1980-1999 (2.5° grid)
    - Operational Analyses 2000-2003 (2.0° grid)
  - NHC/CPHC/DOD Best Tracks (1949-2006)
  - Satellite Water Vapor Imagery
    - GOES-W (1998 – present)
    - GMS-5/GOES-9/MTSAT-1R (2000 – present)
- Updated screening and algorithm processes, using data through 2005 for developmental sample sets

# UPDATED TCFP PRODUCT – EXPANDED DOMAIN

- Expanded domain longitude eastward to 100° E (covers Central & Western N. Pacific Basins)
- Redefined basins based on satellite coverage
- Performed separate screening steps and discriminant analysis on each of the 3 basins.

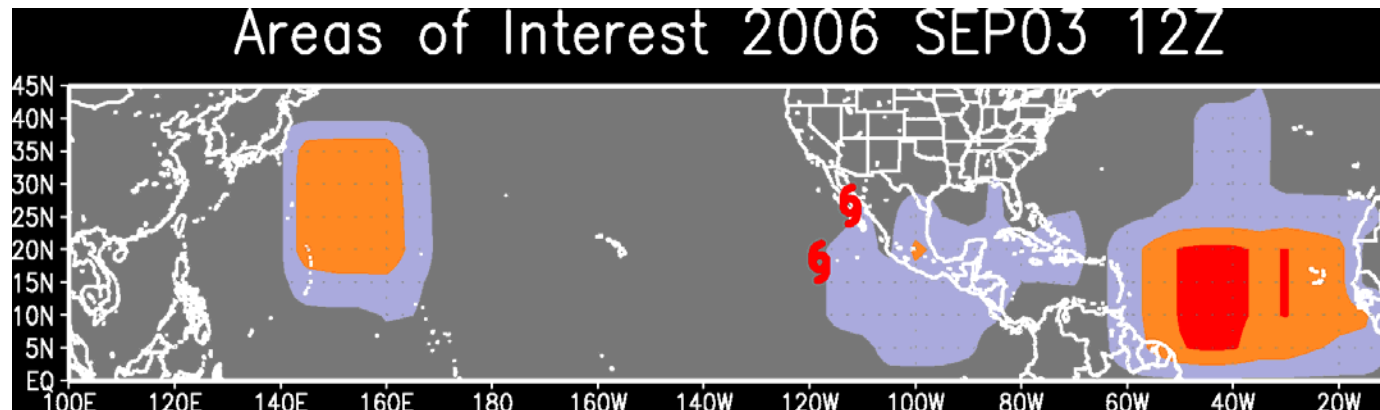

# UPDATED TCFP PRODUCT - MODIFICATIONS

- Added 2004 & 2005 to GOES-E sample set
- Defined screening values and discriminant weights on each of the 3 basins, separately
- Used a Finer Screening Process
  - Updated screening eliminates 5% of genesis cases and 75% of non-genesis cases (increase in eliminated non-genesis cases of ~5% → improve discriminant analysis)
- Added of 850 hPa Horizontal Divergence as a Predictor

# UPDATED TCFP PRODUCT – WEB PAGE

- Updated/extended TCFP product currently running at CIRA, available at <http://rammb.cira.colostate.edu/projects/gparm/>
- Main Page: points out areas of interest for TC genesis formation, links to web page for each basin

*Eg. Main Page graphic from 9/3/06 12Z, 6 h prior to the formation of Florence in the Atlantic & 5 days prior to the formation of WP14.*

# UPDATED TCFP PRODUCT – WEB PAGE (CONT...)

- Example: Western Pacific Web Page Images:

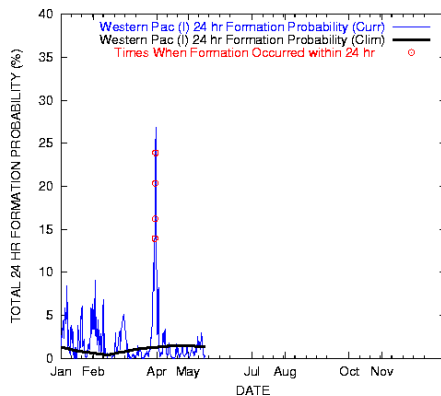

**Formation Probability** (real-time, climatological, & anomaly)

*Eg. Real-time TC formation probability 3/31/07 0Z.*

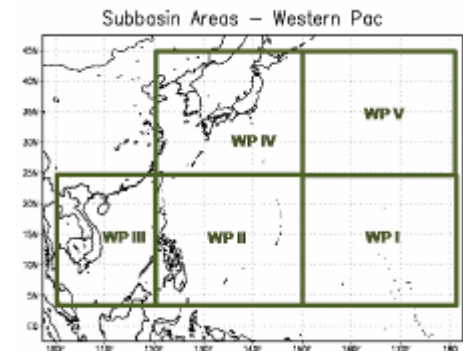

**Predictor Values** (real-time, climatological, & anomaly)

*Eg. Real-time vertical shear, 3/31/07 0Z.*

**Time Series** of Formation Probability & Predictor values summed over subbasins within each basin

*Eg. Formation Prob over WPI*

# UPDATED TCFP PRODUCT – FUTURE

- The updated NESDIS TCFP product will be run locally at CIRA and compared to the current product (running at SSD) throughout the 2007 hurricane seasons.
- Extended product will be evaluated/verified at end of 2007 seasons.
- After evaluation, the extended product will be transitioned to operations with the help of SSD (Ops begin date Jun 2008)

# Satellite support for the NOAA/AOML Hurricane Research Division (HRD) annual field program

- Background / History:
  - AOML/HRD: Miami, FL
    - NOAA's research aircraft (two WP-3D turboprops and a Gulfstream IV-SP jet) flown by NOAA's Aircraft Operations Center (MacDill AFB Tampa, FL)
  - RAMSDIS
    - “Tropical RAMSDIS”, July, 1995, RAMM/CIRA
    - 1996 – “HRD RAMSDIS”

# Tropical RAMSDIS image animations:

- Global geostationary coverage:

- Meteosat-8 at 0 deg lon

- GOES-12 at 75W

- GOES-11 at 135W

- MTSAT at 140E

- Meteosat-7 at 62E

- 1) large area water vapor

- 2) matching large area visible (combined with night-time 3.9 micrometer)

- 3) six movable 4-km Mercator areas (floaters)

- IR

- VIS / 3.9

- 4) two 1-km center relative visible animations using rapid scan images

## **Tropical RAMSDIS supplemental data types:**

- conventional surface observations
- conventional ship and buoy (moored and drifting) observations
- radiosonde observations
- satellite high density winds (from CIMSS, Wisc)
- scatterometer (Quikscat) winds
- numerical model analyses and forecasts (1. NCEP GFS, 2. UKMET, 3. NOGAPS modified by satellite winds from CIMSS)
- hurricane track forecasts from TPC/NHC

## Tropical RAMSDIS products:

### IMAGE:

- CIRA blended total precipitable water
- satellite microwave (SSM/I, AMSU, TRMM, AMSR-E)
- sea-surface temperature
- cloud cleared 3.9 micrometer night-time skin temperature
- long wave difference (dust)

### ANALYSIS:

- digital Dvorak hurricane intensity estimate
- vertical wind profile areal wind averaging  
(for vertical shear analysis, using numerical model fields)

## **Additional RAMM real-time TC products and RAMSDIS accessible data:**

- Tropical cyclone surface wind analysis
- Ocean heat content
- AMSU intensity estimates and vertical structure analysis
- RAMM Genesis parameter
  
- high resolution polar orbiter images (MODIS and AVHRR)
- NexRad NWS radar
  
- SHIPS and STIPS (Statistical Intensity forecast guidance)
