

Monitoring Malaria from Operational Satellites

Felix Kogan

NOAA/NESDIS/STAR

COLABORATORS

Wei Guo – IMSG

Al Powell - STAR

Dan Mandl – NASA

Alejandro Deeb – World Bank

Leny Roytman, Atiqure Rahman, Mahomed Nizamudin – NOAA/CREST

Ramesh Dhiman – Malaria Institute, INDIA

Guido Van Langenhove – Met Services, NAMIBIA

Joerg Szarzynski – UN SPIDER

Marco Vargas – STAR

OUTLINE

- Background
- Malaria and Environment
- AVHRR Sensor & Data
- Vegetation Health (VH) System
- Data Applications & Interpretation
- Challenges

Global Burden of Infectious Diseases Caused by Arthropod Vector

Global Burden of Infectious Diseases Caused by Anthropod Vector

Diseases	Disease Burden (% from total)	Mortality (% from total)
Malaria	78	89
African trypanosomiasis	3	3
Lymphatic filariasis	10	0
Dengue fever	1	2
Leishmamiasis	5	5
Chaga disease	1	1
Onchocerciasis	2	0

Based on Disability Adjusted Life Years (DALY) – the number of healthy years of life lost due to premature death and disability (World Health Organization 2002, The World Health Report, Geneva).

WORLD Malaria Facts

Malaria Geographic Distribution

- **107 world countries** are affected
- **3.2 billion people** (48% of the world) are at risk
- **300–500 million** annual malaria cases
- **1.5-3 million people die** annually (4-5% of global fatalities)
- **Children (C) & Pregnant women (PW)** vulnerable
(C): One million dies annually; (PW): 10% maternal death
- ***P. falciparum*** and ***P. vivax*** cause of death (**one million** deaths caused by *P. falciparum* only)
- **Area:** Africa, Asia, Latin America, the Middle East & part of Europe
- **Expenditure:** 40% of **Africa's** health
- **Sub-SAHARA Africa** contributes: **60%** of global, **75%** of *P. falciparum* & **80%** of deaths cases; **Every 30 sec** a child dies

MALARIA & ENVIRONMENT

- **CLIMATE & LANDSCAPE** determine
distribution of mosquito-borne diseases
- **WEATHER** affects
timing, duration, area and intensity of outbreaks
- **WARM & WET** surface stimulates
mosquito's activities to carrying the disease to people

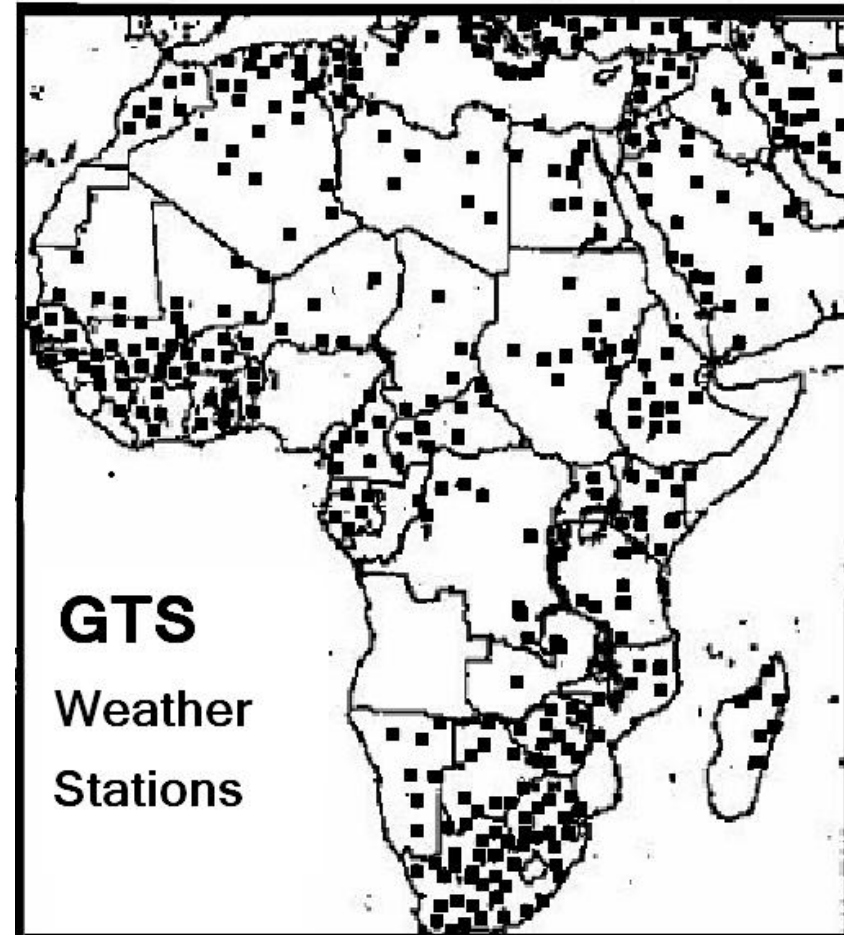

Correlation between malaria cases & weather data, **TANZANIA**, *Hai District*

MONTH	Rains	Tmax	Tmin
May	0.24	0.45	0.45
Jun	0.38	0.36	0.29
Jul	0.41	0.29	0.30
Aug	0.29		0.42

THEORY

Typical Vegetation Reflectance

Vegetation Reflectance

VIS reflectance depends on
CHLOROPHYLL
CAROTENOID

NIR reflectance depends on
WATER CONTENT
CELL STRUCTURE

VIS NIR

$$NDVI = (NIR - VIS) / (NIR + VIS)$$

NDVI & Reflectance

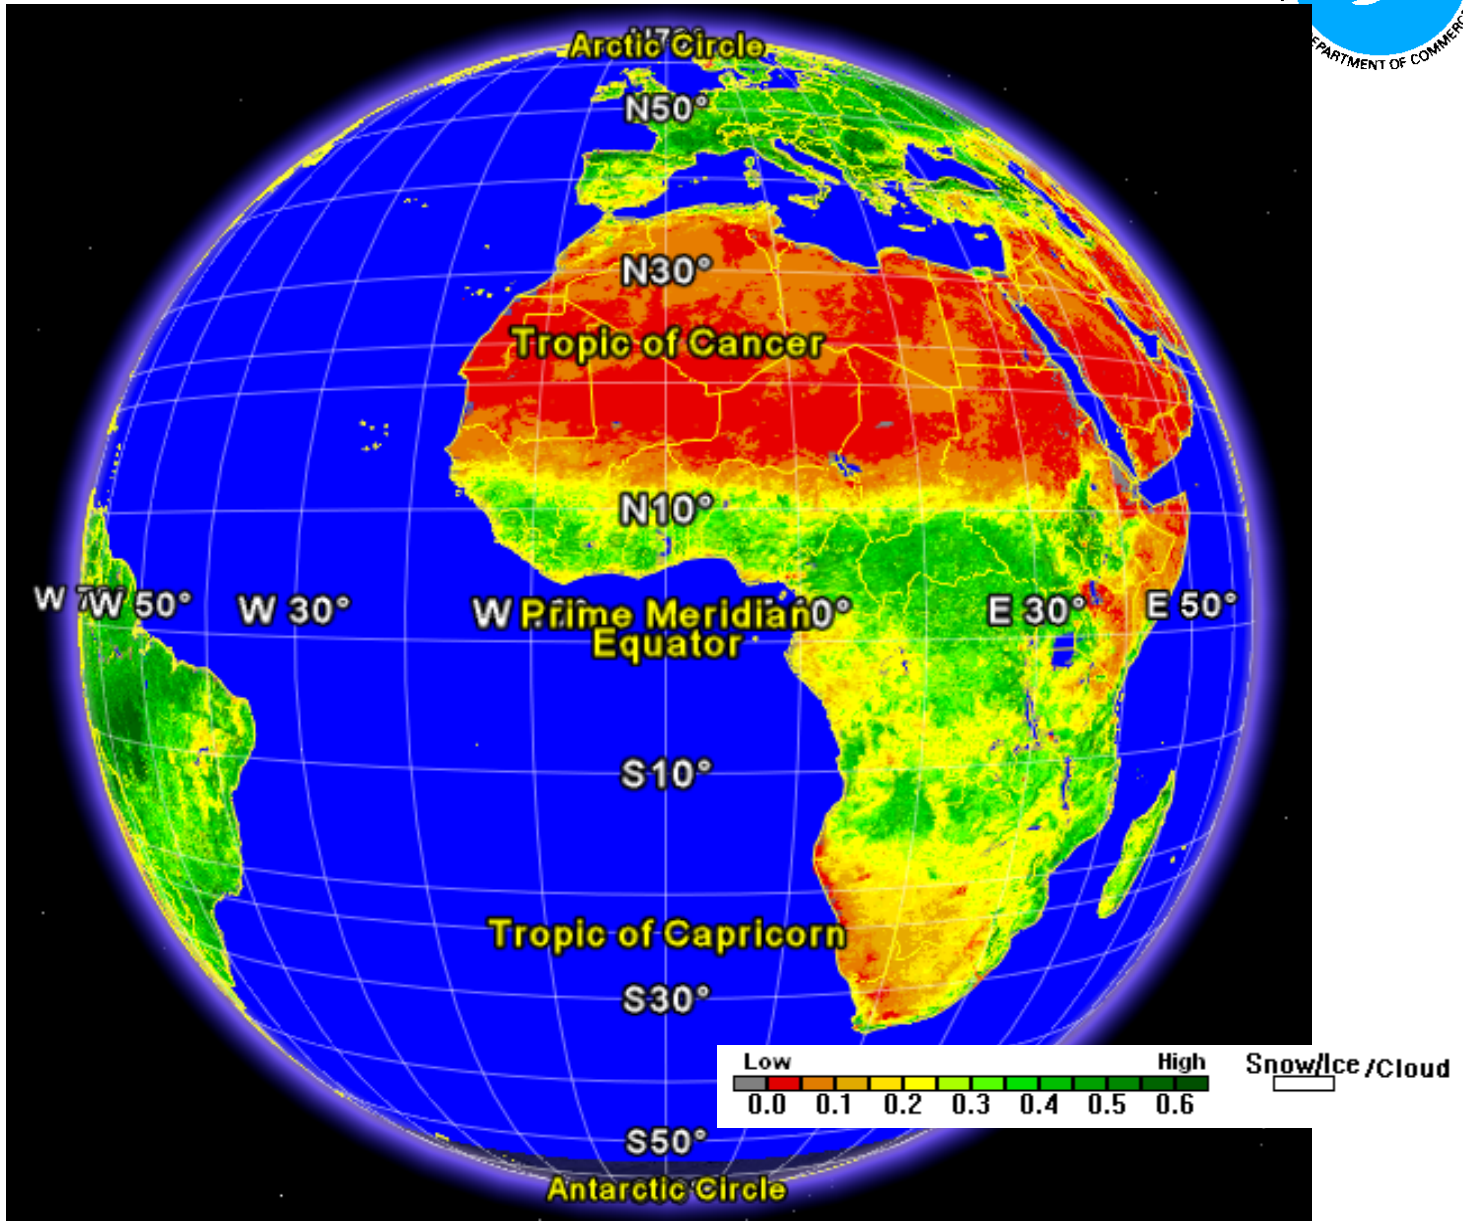

Cover Type	Ch1	Ch2	NDVI
Vegetation: Dense	.050	.150	0.500
Medium	.080	.110	0.140
Light	.100	.120	0.090
Bare Soil	.269	.283	0.025
Clouds	.227	.228	0.002
Water	.022	.013	-0.26

$$\text{NDVI} = (\text{Ch2} - \text{Ch1}) / (\text{Ch2} + \text{Ch1})$$

NDVI from MSG-2 SEVIRI

June 2007

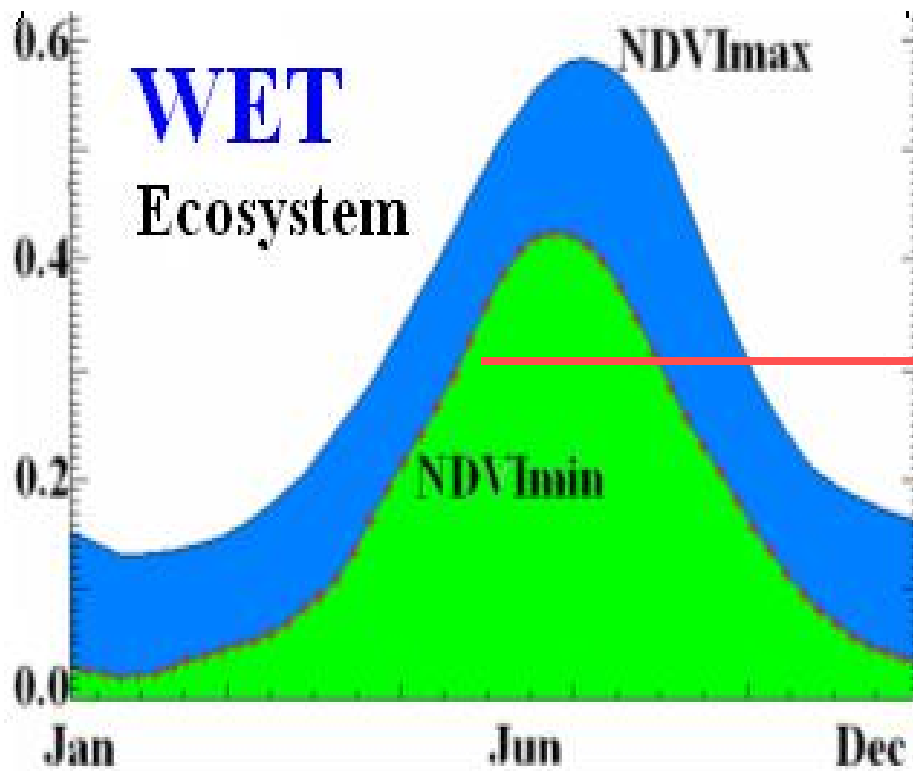

NDVI & Rainfall (% mean), SUDAN (1984-1987)

NDVI in **Dry** & **Wet** Ecosystems

NDVI_{max} indicates **HEALTHY** vegetation

NDVI_{min} indicates **UNHEALTHY** vegetation

A VHRR-based VH Indices

Vegetation condition index (VCI), values 0 - 100

$$VCI = \frac{NDVI - NDVI_{min}}{NDVI_{max} - NDVI_{min}}$$

NDVI_{max}, and NDVI_{min} – climatology (1981-2000 maximum and minimum NDVI for a pixel;

MOISTURE

Temperature condition index (TCI), values 0 - 100

$$TCI = \frac{BT_{max} - BT_{min}}{BT_{max} - BT_{min}}$$

NDVI_{max}, and NDVI_{min} – climatology (1981-2000 maximum and minimum NDVI for a pixel

THERMAL

Vegetation Health Index (VHI), values 0 – 100

$$VHI = a * VCI + (1 - a) * TCI$$

**VEG.
HEALTH**

0 – indicates extreme stress

100 – indicates favorable conditions

Vegetation Health (VH) System

- **Satellites:** **NOAA**
- **Sensor:** **AVHRR**
- **Records:** **30-year**
- **Characterize:** **LAND SURFACE**
GEENNESS (Chlorophyll)
MOISURE (Vigor)
THERMAL (Temperature)
- **Assess:**
VEGETATION HEALTH
CUMULATIVE impact “have memory”
from **EXTREME STRESS** to **FAVOURABLE**
- **Issued**
WEEKLY
4 km PIXEL
ALL LANDSCAPE
- **Products:** **VEGETATION HEALTH, MOISTURE (VCI),**
THERMAL (TCI) CONDITION

Vegetation Health Interpretation

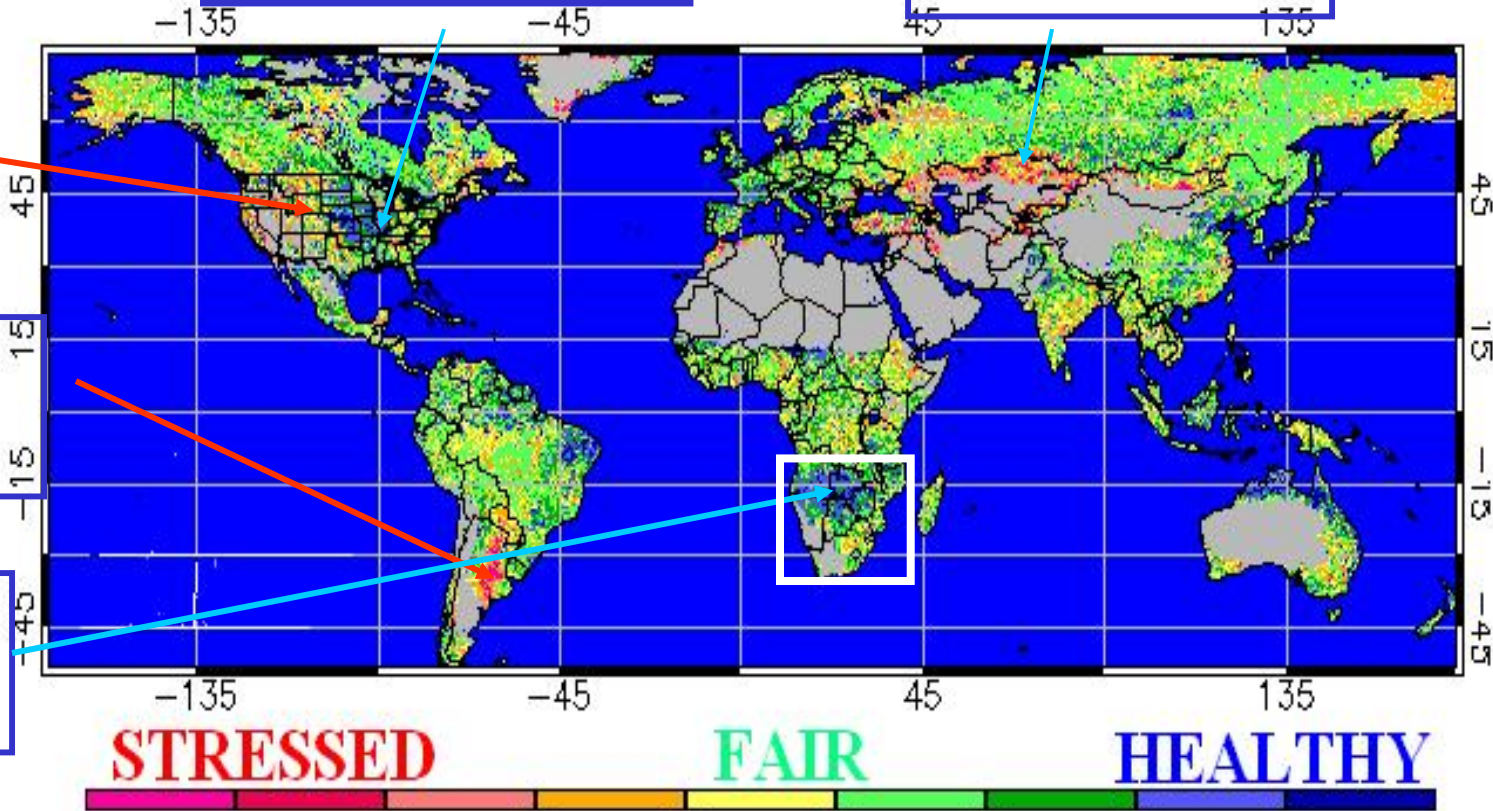

Central USA
Healthy vegetation
Impact: *Good crops*

Kazakhstan
Vegetation stress
Impact: *Bad crops*

Western USA
Vegetation stress
Impact: *Fire*

Argentina
Vegetation Stress
Impact: *Drought*

Southern Africa
Healthy Vegetation
Impact: *Malaria*

Vegetation Health, August 26 2008

Significance: Vegetation Health estimates vegetation condition – a proxy for drought, crop & pasture production, fire, malaria; <http://www.star.nesdis.noaa.gov/smcd/emb/vci/VH>

2008 VH s-c AFRICA

in semi-arid
climate

Climate controls selection of VH strategy

Plasmodium vivax & P. falciparum in village studies, INDIA

Month wise, year wise cases of Plasmodium vivax and P.falciparum recorded in study villages between 1989-2000.

Breeding Sites

Labour Camp

Treated Bed Nets Evaluation

Validation: VH & Malaria in INDIA

Karnataka, Raichur

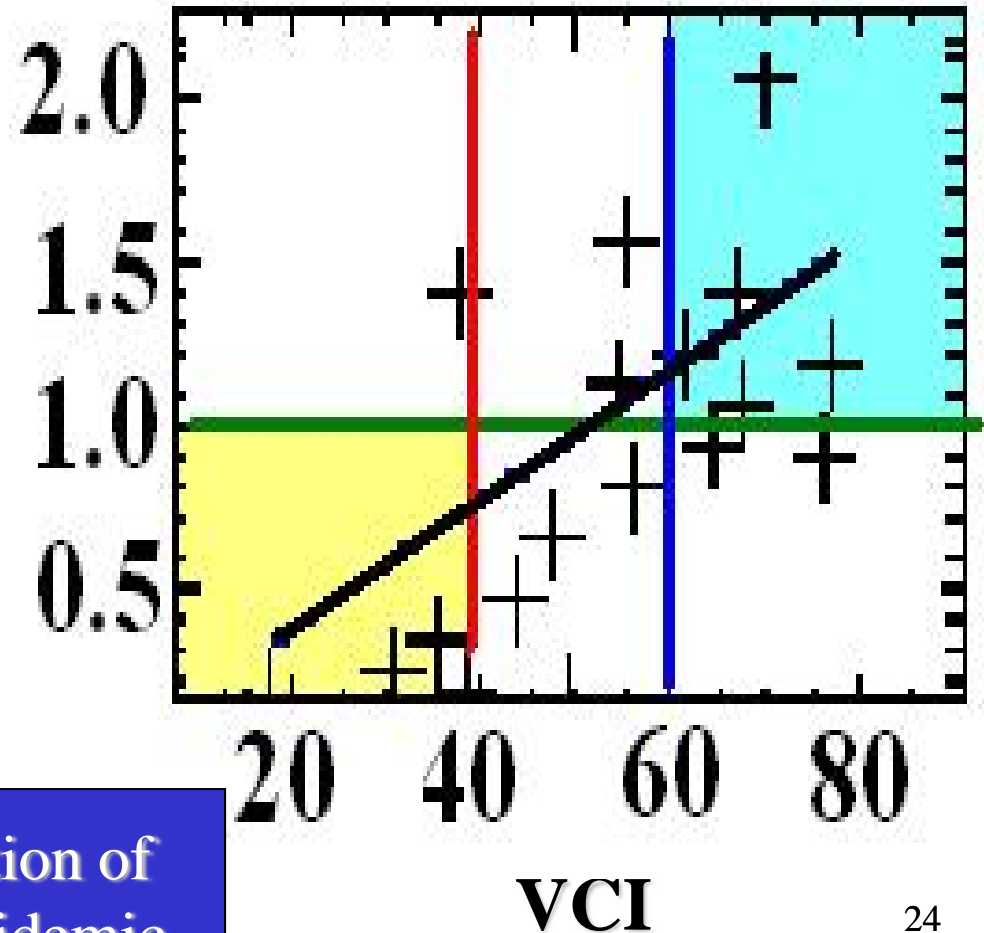

(Correlation of Malaria Cases (Annual Malaria Incident (AMI)/Trend of AMI) with Moisture Index (VCI))

VCI < 40 (dry) –
Lower AMI

VCI > 60 (wet) –
Larger AMI

Rainfall 600 mm/year

Ratio Malaria Cases

VH is a good proxy for estimation of vegetation health & malaria epidemic

VALIDATION: Malaria (%)

Observed vs. VH-Simulated

Gujarat INDIA

VALIDATION: Malaria observed vs. VH (TCI)-simulated Caprivi NAMIBIA

Malaria Simulation for Caprivi, NAMIBIA

Lat 17.5-18.0 S; Long 21.5-22.10 E

$dY = 60.26 - 0.34TCI49 + 0.34TCI50 + 0.65TCI51 + 0.08TCI52$

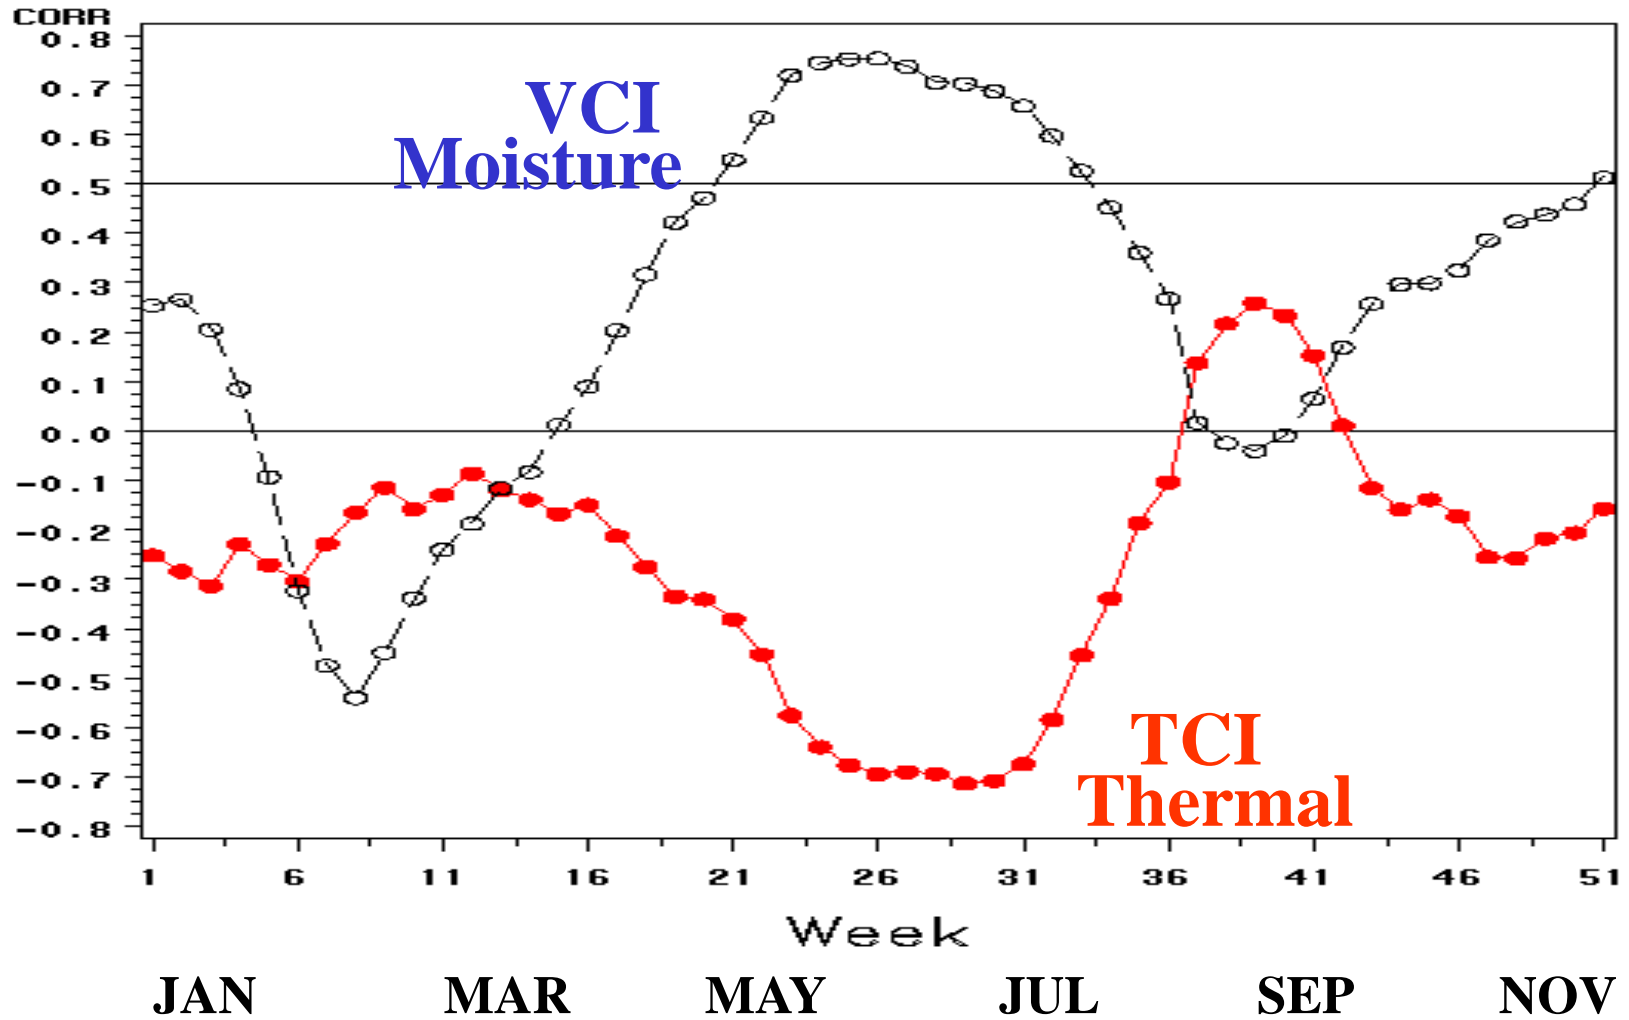

Malaria Cases (%)

Choco COLOMBIA

Correlation: Malaria Cases (%) with VCI & TCI Choco COLOMBIA

Strategy: PREDICTION

Kisii District Hospital KENYA

Malaria & VH

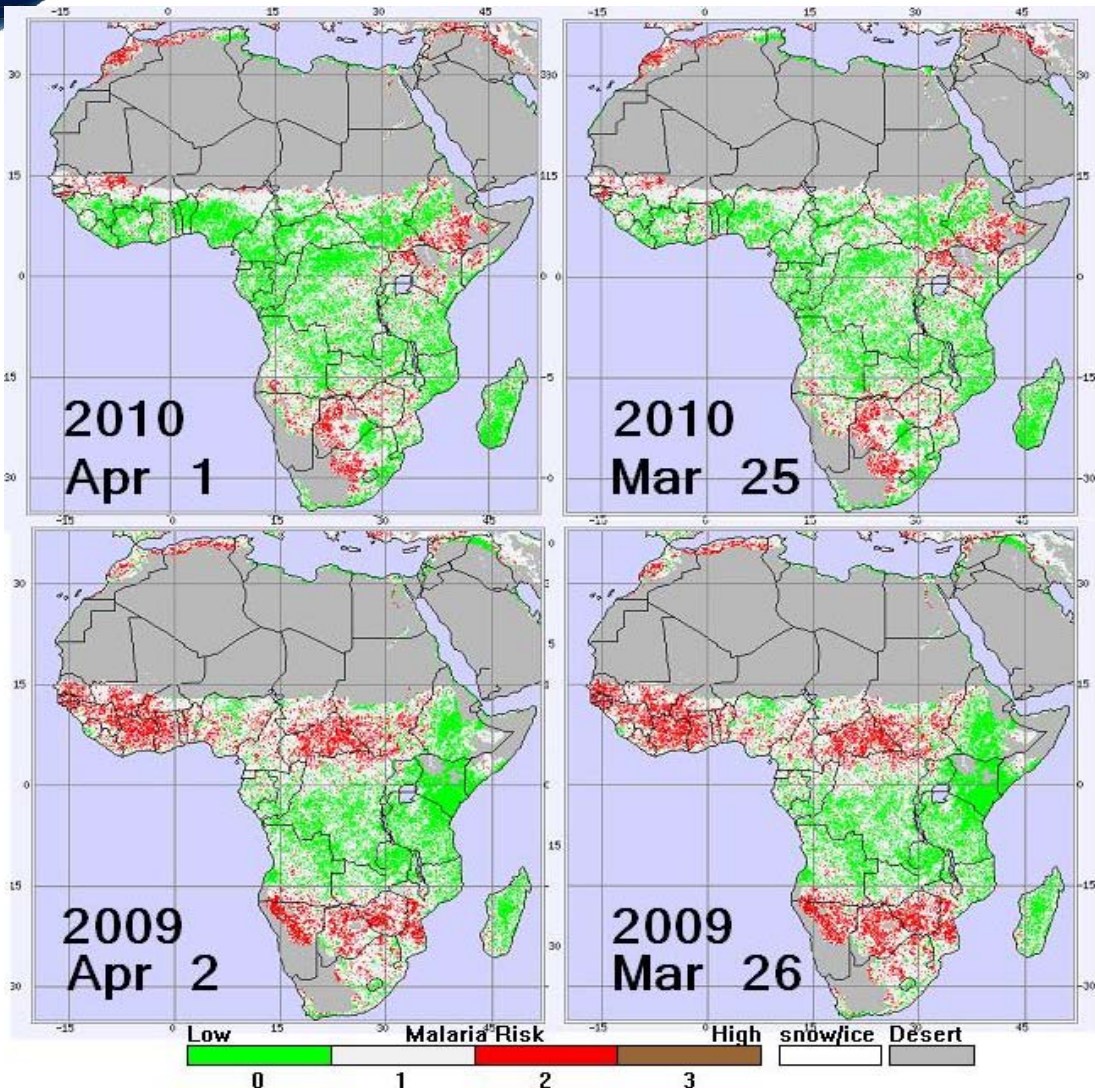

- (1) High VH (green circle) occurs 1-4 months prior to the malaria peak (red circle)
- (2) VH correlates with malaria cases & can be used as epidemic predictor
- (3) In 1998, malaria peak shifted to spring - similarly VH

- VH provides up to 4 months advance malaria warnings
- The warnings must be area specific

VH-based Malaria Risk

2010

2009

VH-based Malaria Risk

AVHRR/NOAA-18

http://www.star.nesdis.noaa.gov/smcd/emb/vci/VH/vh_browse.php

Combat Malaria Programs

- UN Malaria Envoy
- Roll Back Malaria Partnership
- Global Fund to Fight Aids, TB & Malaria
- Presidential Malaria Initiative
- Melinda & Bill Gates Foundation
- US Congress (2009-2013)

PMI Program

- Indoor Residual **Spraying** (IRS)
- Insecticide Treated **Nets** (ITN) incl. LLITN
- Artemisinin-based combination **therapy** (ATC)
- Intermittent preventive **treatment** for pregnant women (IPTp)
- Improving infrastructure and technology

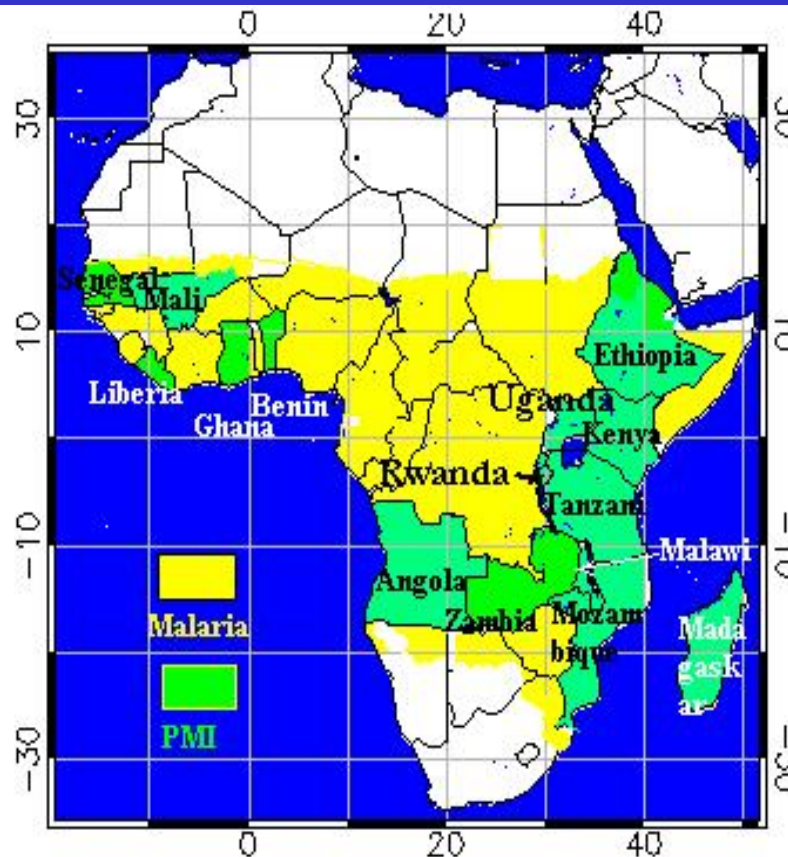

PMI: Goals & Countries

June 2005, President G.W. Bush announced a **\$1.2 billion** aid package for AFRICA: **Reduce 50% malaria death in 15 countries**

- SENEGAL
- MALI
- LIBERIA
- GHANA
- BENIN
- ETHIOPIA
- KENYA
- UGANDA
- RWANDA
- MALAWI
- TANZANIA
- MOZAMBIQUE
- ZAMBIA
- ANGOLA
- MADAGASCAR

Area – 3,243,000 sq. mi. People – 343,000,000

2003 Malaria PMI Countries

Endemic Area

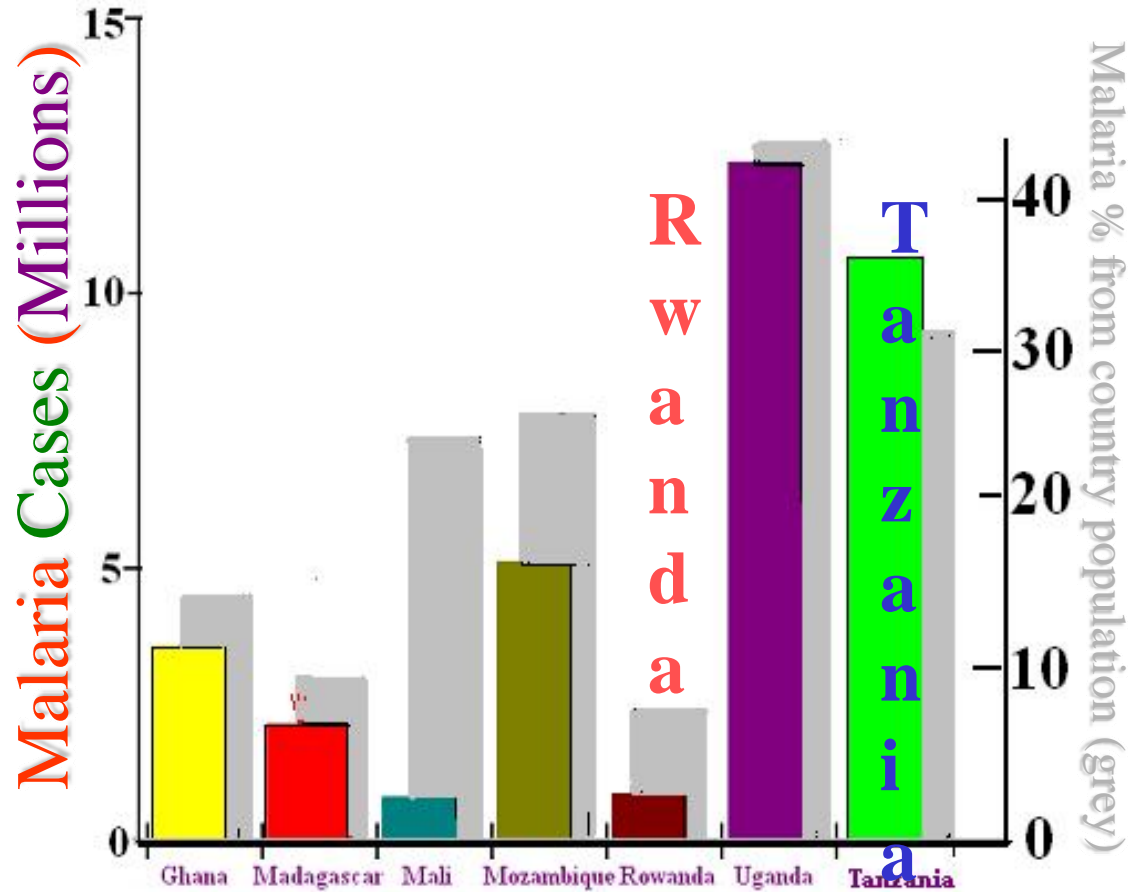

POPULATION AFFECTED

- Rwanda 1.5 mil. (9% pop.)
- Uganda 13.0 mil. (41% pop.)

MALARIA CASES are SPECIFIC to

- Country
- Affected area
- Population
- Weather
- Climate
- Malaria Intensity

VH PROVIDES COMBINE ESTIMATION OF THESE CONDITIONS in ENDEMIC AREAS

<http://www.wno.int>

VH diagnoses malaria risk over a country & an area advising on cost-effective resource distribution

VH-Malaria Risk Area as a predictor, 2003

Endemic Area

TANZANIA

-25-30% malaria risk area, Sep-Jan
 - April-June provided 3-4 months advance malaria indication

Area – 369,000 sq mi Popul. - 40,400,000
TANZANIA (31% affected pop.)

RWANDA

-<5% malaria risk area, Sep-May
 - Pre-season malaria risk area was low indicating no malaria risk

RWANDA (8.5% affected pop.)
 Area – 10,000 sq mi Popul. 9,700,000

- * VH provides malaria risk area for an entire country
- * Pre-season VH forecasts malaria epidemics

VH Malaria Risk Area (%) by Intensity UGANDA

AREA - 94,000 sq mi. PEOPLE - 30,900,000

Malaria risk area: 1 - Low-to-High total; 2 - Low; 3 - Moderate; 4 - High

Percent (%) of UGANDA under malaria risk of different intensity

VH

(a) Provides risk area & epidemic intensity

(b) Validates effectiveness of fighting measures

GOALS

- **Early detection of environmental conditions conducive for mosquito development & spread of malaria using operational satellites**
- **Monitoring Malaria Start/End, Area, Intensity & Impacts**

NOAA Capabilities (Examples)

KENYA: RVF (Rift Valley Fever) & Vegetation Health (VH)

1996-97
VH < 20 - Severe DROUGHT – NO RVF epidemics

1997-98
VH > 80 - FAVORABLE condition – Intensive RVF epidemics

VEGETATION HEALTH, Kenya

NOAA-14

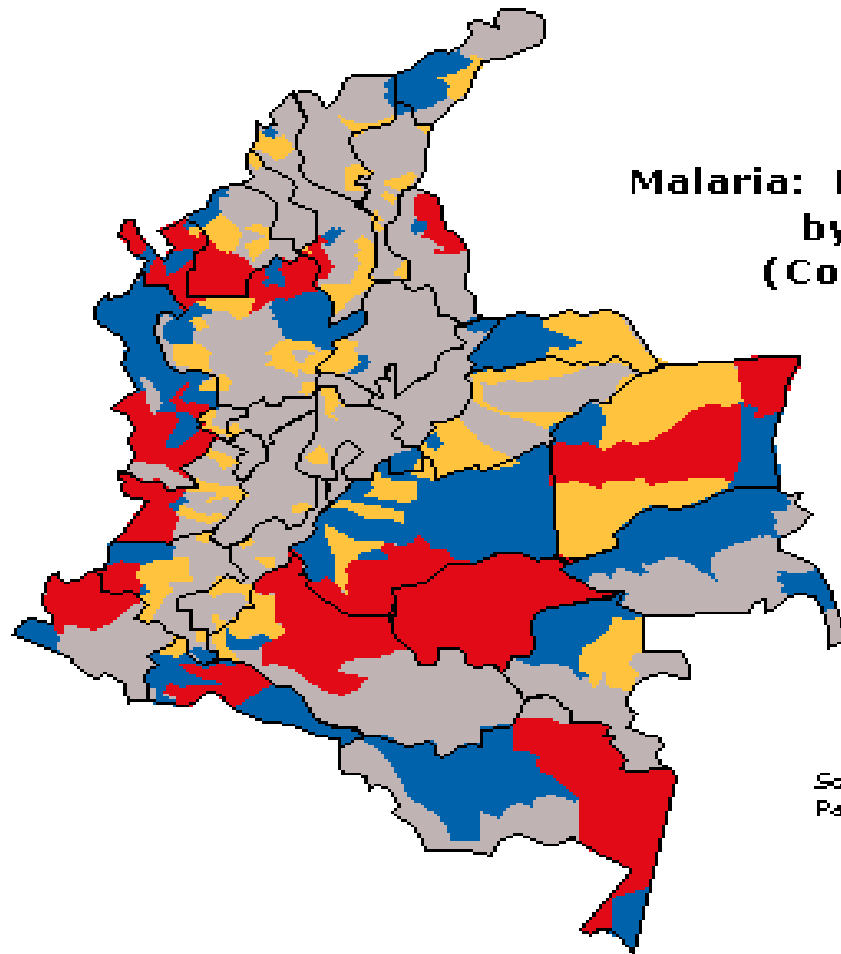

1997-1998 Rift Valley Fever (RVF) Epidemics in Kenya
1996-1997 NO Epidemics

NOAA has capability to identify & monitor other mosquito-born diseases

Challenges in Monitoring Malaria

COLOMBIA

**Malaria: Epidemiological Map
by Risk Levels
(Colombia, 1999)**

- High risk
- Moderate risk
- Low risk
- No risk

Source:
Pan American Health Organization, 2000.

Satellite data are proxy requiring calibration & validation

CHALLENGES in treatment

- **Increasing mosquitoes resistance to insecticides**
- **Parasite resistance (undermine malaria control)**
- **Changes in mosquitoes behavior due to treatments**
- **Changes in ecology due to human activities**
- **Diminishing number of effective insecticides**
- **No alternatives for DDT and pyrethroids**
- **Limited evidence of the treatment impact**
